

Frontend Coding Test

Alongside this Requirements document, you will see two images called **Design**. One of animated the other is not. This is a design that allows a customer to withdraw money from one of their pots.

The image shows a web application interface for withdrawing money. At the top, there is a header bar with a green border. On the left is a '< Back' link, in the center is the title 'Withdraw', and on the right is a help icon (a question mark inside a circle). Below the header is a large light gray area containing a white modal box titled 'Pick a pot'. Inside the modal, there is a subtitle 'Please choose a pot to withdraw from'. Below this, there are three options, each with a radio button to its right: 'My Nutmeg pot' with '£2,345 available', 'My Summer Holiday pot' with '£23,406 available' (this option is selected, indicated by a blue filled radio button), and 'My Lifetime ISA pot' with '£1,203 available'. At the bottom of the modal, there are two buttons: a 'Back' button on the left and a green 'Next' button on the right.

We have set up a skeleton application that includes just the header at the top. Everything below the header does not exist in the codebase.

The react application when you **npm run start** will show like below.

[Check the README steps to get the application ready for development.]

The image shows a web application interface for withdrawing money. At the top, there is a header bar with a green border. On the left is a '< Back' link, in the center is the title 'Withdraw', and on the right is a help icon (a question mark inside a circle). Below the header is a large light gray area containing the text 'Happy Dev'ing' followed by a small icon of a person with a wrench.

We'd like you to spend as little or as long as you would like on building the rest of the design. The main things we are looking for are:

1. Code structure
2. Semantics
3. Best practices
4. Styling approach
5. Accessibility standards
6. Documentation
7. Optimisation
8. Code Reusability

We will also be identifying any: code smells, unorganised markup, overengineering, inconsistent code formatting and bad naming conventions so please be mindful of this.

You can retrieve the array of pots when running server in application <http://localhost:3004/pots>
Only pots that are withdrawable should show.

As a visual reference, you can find our style guide here:

<https://www.nutmeg.com/guidelines>. We've also included our primary font, Gotham, for your use in the application so you don't need to spend time importing it.

Please bear in mind the following:

- The **index.css** should be ignored as it's just compiled CSS taken from our Design system.
- The Header component is also just wrapping compiled HTML and should not be considered good practice.

When you're done:

- Send us your code via CVS, Bitbucket [private repo], Github or zip, so that we can review your work.
- Make a note for yourself of your reasoning behind how you approached the problem — we'll discuss it all with you in your final interview.

Good luck! – Nutmeg team
